Summer 2026

Assignment 3

Point Value: 20 points

Due: Thursday June 11, 2026, 11:59pm

Description

1. **Python Basic and Intermediate Programming** – Complete the following requirements.

The provided text file in Folio (grades.txt) contains information about people and their grades. The data is arranged as: first name(s)<space character>last name<comma character>grade, one person per line. It may help to open the file and examine the structure before working on this assignment.

Using the provided text file, write a Python program named assign3<LastName>.py that calculates and displays the following items:

Average grade

Highest grade and the name of the person who made it

Lowest grade and the name of the person who made it

For the names, you may use the last occurrence if there are any duplicated grades.

After those values have been calculated and displayed, have your program display counts of students that scored higher than the average and the percentage of total students that represents, then display lower with the percentage as well.

For instance, for the provided text file, the expected output would look like:

Average: 75.86967999999999

Maximum: 99.9 (Nadia Mcinnish)

Minimum: 50.07 (Cecilla Bruse)

Grades above average: 123, 49.2%

Grades below average: 127, 50.8%

HINTS: Using lists will make parts of this assignment easier, but they will not solve all problems. Using smart, effective string operations will make separating the name from the grade straightforward. Adding some functions to help clean up the code might also help. Determining the counts above/below average can only be done AFTER calculating the average or your numbers will be incorrect.

2. Take a screenshot of your output including any command(s) you used to run your program.

3. Submit your Python code and screenshot to the correct Folio Assignment dropbox.
Documents that are not in source code format (plain text*) will not be graded and receive a grade of 0.

*** What is a plain text file?** Any file that you can open with a text editor (like Notepad) and read directly is a plain text file. Python files should have a file extension of .py but are still considered plain text.

Deliverables

Assignment 3 is to be individual work. Submit the required materials by the specified due date to the correct Folio dropbox.
